Numerical Integration Example: Falling Climber T can be determined analytically, how the rope deflects requires numerical methods $T = V = Z \delta f 0$
 $F \cdot dr$ The rope behaves as a nonlinear spring, and the force the rope exerts F is an unknown function of its deflection $\delta \bullet \dots$

Learning different numerical methods and their analysis will make a person more familiar with the technique of developing new numerical methods
 This is important when the available methods are not enough or not efficient for a specific problem to be solved 2 In many circumstances, one has
 more methods for a given problem

Vector Calculus - mecmath

1 Vectors in Euclidean Space 11 Introduction In single-variable calculus, the functions that one encounters are functions of a variable (usually x or t)
 that varies over some subset of the real number line (which we denote by R) For such a function, say, $y=f(x)$, the graph of the function f consists of
 the points $(x,y)=(x,f(x))$ These points lie in the Euclidean plane, which, in the Cartesian

 results from different numerical schemes, discretizing methods, and mushy zone con-stants have been compared in a recent review¹³ It is found that
