Right Proximal Tibia Open Reduction Internal Fixation

An open reduction and internal fixation (ORIF) is a type of surgery commonly used to fix broken bones in the body. The surgery is comprised of two parts. First, the bone is reduced or also known as setting back in place. After the bone is set, it is then fixated with screws, rods, plates and pins. It is

Documentation Dissection - AAPC

Internal fixation was also applied. It is important to verify the use of internal fixation within the description of the procedure [4]. Indicates an open procedure [5]. This indicates the type of fracture (distal radius) and of reduction to return the bone back to its neutral position.

Original Article Supraclavicular nerves protection during ...

Open reduction and internal fixation (ORIF) is the standard surgical treatment for displaced clavicle fractures [17, 18]. Meanwhile, plate fixation is recommended due to providing immediate rigid fixation and helping to facilitate early mobilization [15, 19]. Thus, we performed this prospective study to investigate the efficacy.
